Installing the X360

Figure 1

Important: Read all instructions very carefully before installing your X360 XHO ADD-ON KIT. Reef Brite will not be responsible for any damages that may result from improperly mounted or installed X360 kits.

The X360 will add some weight to your light system so it is especially important to ensure your tank can safely carry and distribute the additional weight of the X Series system.

These will not work with Flex arm mounts.

If you have any questions before or during the installation of your X Series system, please contact joy@reefbrite.com and one of our customer service representatives will be glad to assist you.

Getting started: Make sure your fixture(s) are unplugged from the electrical outlet and completely removed from the aquarium before attempting to install the X360.

If your fixture was in use even for just a short period let cool. LED's can get hot during operation and can cause personal injury or damage surfaces if proper care in handling is not taken.

Once cool, place fixture on a secure table or work surface.

It is also recommended to completely remove your Kessil arm while installing the X360.

Take the light mount included and place it on top of your A360x so that the holes align with the holes used for the Kessil mount.

Now place the Kessil mount on top of the bracket and secure it to your A360x.

Slide the included XHO's through the bracket arms.

Using the included end plates mount them to the XHO's as pictured in figure 1.

Carefully reinstall to your Kessil Arm mount to your tank making sure everything is completely secure.

Important note: Make sure all power supplies, electrical plugs, and electrical outlets are safely located so water cannot splash or spill on them. Use of power strips located on floors or any location where water can come in contact with them is dangerous and can cause serious injury or fire.

Hanging options:

It is possible to suspend your X360 using the optional Reef Bright LED cable suspension kit.
